Sure, I was trying to refer back to tables in sections of the Formaldehyde draft toxicological review that we received back in July.

I've attached my copy for you- feel free to ignore my various notes or comments on it.

I think John W was pretty thorough in making sure that those kind of co-exposure studies were not tabulated in the cancer hazard section, but who knows.

I believe that the table you're looking for starts around page 342.

Dear Jason,

You cited this table as a source of your info on rodent tumors(Table 1-52 Section 1.3.1.3).

Can you please send me a copy of that. I am looking at the IARC 88 monograph and there are several studies in which rodents were exposed to formaldehyde and hydrogen chloride at the same time to maximize formation of bis(chloromethyl)ether in situ in the chamber. I need to make sure none of those studies ended up in our tables as formaldehyde studies.

I hate to be that way but I can quickly tell if it is same study from author.
